

Undo/Redo for Text Input (PDF)

Problem Statement [🔗](#)

Create an undo/redo system for a **text input** (without UI).

Fill out the methods so that:

- `edit(text: string)` updates the text.
- `undo()` reverts the last text edit.
- `redo()` re-applies the last undone text.
- `getCurrentState()` returns the current text.

Skeleton Code

```
class TextInput {
  constructor() {
  }

  edit(text) {
  }

  undo() {
  }

  redo() {
  }

  getCurrentState() {
  }
}

const editor = new TextInput();
editor.edit('First version');
editor.edit('Second version');
editor.undo();
console.log('1:', editor.getCurrentState()); // Should return "First version"
editor.redo();
console.log('2:', editor.getCurrentState()); // Should return "Second version"
editor.undo();
console.log('3:', editor.getCurrentState()); // Should return "First version"
editor.edit('Third version');
console.log('4:', editor.getCurrentState()); // Should return "Third version"
editor.undo();
console.log('5:', editor.getCurrentState()); // Should return "First version"
editor.redo();
console.log('6:', editor.getCurrentState()); // Should return "Third version"
```
